To Whom it May Concern:

As a leader in the development of clean energy technologies, Siemens Energy is always looking for capable, forward-thinking technology partners. Big Navajo Energy (BNE) is one such company. As a result of the substantial development efforts BNE and their consortium partners have invested, Siemens is pleased to contribute technical and commercial resources to help bring the various phases of this hydrogen project to fruition.

Siemens continues to research, promote technologies and align itself with companies and projects that have the potential to offer technical advances as well as economic and environmental improvements. We consider BNE to be a strong asset in the development of this and future projects that expand the use of hydrogen in North America.

We look forward to supporting BNE and their consortium partners in these endeavors. Should you have any questions or like more detailed information, please feel free to contact me directly.
